

STABILITY DATA SUREFUSER+

Division: Hospital Products | Version: 2022

1. Introduction

Surefuser™+ is an elastomeric infusion pump for single-use. It is prescribed for the controlled infusion of medications (e.g. antibiotics, chemotherapeutics, painkillers) in an ambulatory and home-care setting.

Surefuser+ is the optimal user-friendly choice for patients. It does not require batteries or electricity, which renders it lightweight and discreet. There are no complicated settings or alarms, making it hassle-free.

For more than 15 years, Nipro has perfected the design of Surefuser+. It is a closed system that ensures patient safety and a high-performance treatment.

Surefuser+ complies to ISO-28620.

2. Stability data

This document contains a summary of *in vitro* chemical and physical stability tests of more than 35 different drugs using Surefuser+ elastomeric infusion pump.

The stability of each drug was evaluated in independent certified laboratories according to their Standard Operating Procedures, following a predefined protocol, and under controlled conditions.

The stability of each drug was analyzed in physiological solvents commonly used for infusion, including NaCl 0.9%, glucose 5%, and dextrose 5%.

The concentration of the drug at different points in time was measured using high performance or ultra performance liquid chromatography (UPLC) techniques. The drug was considered stable when the concentration was within a predefined range of the initial concentration (e.g. 95-105%).

Please note that the evaluation of the sterility of drug solutions was not part of the experimental scope.
